changing $-\underline{p} \to \tilde{\underline{p}}$

$$= (-)^S\, |\Psi, S=0,1\rangle$$

c) $C A_\mu C^{-1} = -A_\mu \Rightarrow$ photo is its own antiparticle

eigenvalue -1

$$C\,|n\rangle = C\, \underbrace{|\gamma\rangle \otimes \cdots \otimes |\gamma\rangle}_{n}$$

$= (-1)^n |n\rangle$

$C|\Psi, S=0\rangle = |\Psi, S=0\rangle \Rightarrow$ decay into even numbers of photons
2, 4, 6, ...

$C|\Psi, S=1\rangle = -|\Psi, S=1\rangle \Rightarrow$ decay into odd numbers of photons
3, 5, 7, ...

For these two decays, same intial state, $S=1$ decay has more possibilities for final states.

$\Rightarrow \Gamma_{S=1} > \Gamma_{S=0}$

$\Rightarrow \tau_{S=1} < \tau_{S=0}$, not consistent...
